                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid sequences (AAX22111 to AAX22134)
CC encoding human secreted proteins (AAY01135) to AAXV01159). The secreted
CC protein gene sequences are deposited with the ATCC under deposit number
CC ATCC 209118. Host cells comprising recombinant vectors containing the
CC nucleic acid sequences are used for the recombinant production of the
CC secreted proteins. The polynucleotide and amino acid sequences are useful
CC for are useful for preventing, treating or ameliorating medical
CC conditions e.g. by protein or gene therapy. Pathological conditions can
CC be also diagnosed by determining the amount of the new polypeptides in a
CC sample or by determining the presence of mutations in the new
CC polynucleotides. Specific uses are described for each of the
CC cancer, tumours, developmental abnormalities and social deficiencies,
CC cancer, tumours, developmental abnormalities and cognitive disorders,
CC schizophrenia, immunological disorders, immune deficiency diseases
CC (AIDS), mood disorders, neural disorders, arthritis, asthma,
CC osteoporosis, metabolic disorders, caralovascular disorders, sendocrine
CC disorders or gastrointestinal disorders. The polypeptides are also useful
CC for identifying their binding partners. The present sequence represents a
CC combine and clone identification (see descriptor line for gene
                                                                                                                                                                                                                                                                                                               Matches

The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kato

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to modulators of a cancer-related genes. Also CC described are: (1) processes for identifying an anti-neoplastic agents CC compositing contacting a cell exhibiting neoplastic activity with a CC compound first identified as a cancer related gene modulator, and CC determining the cancerous state of a cell by determining an increase in the neoplastic activity. (2) a process for CC determining the cancerous state of a cell by determining an increase in CC the level of expression of at least one gene, where an elevated CC expression relative to a known non-cancerous cell indicates a cancerous state or potentially cancerous state. The anti-neoplastic agent is CC useful for treating cancer or for protecting an animal against cancer. CC the immunogenic composition is also useful for treating cancer in an CC animal, where the composition elicits the production of cytotoxic TC lymphocytes specific for the immunogenic composition. Preferably, the CC animal is a human. The cancer-linked genes and polypeptides are also useful as targets for cancer therapy or chemotherapy. The present CC useful as targets for cancer-linked gene located on chromosome 12, which encodes transmembrane protein 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                        The specification describes a method of antibody preparation. The method comprises inoculating an animal with a vector expressing a fusion protein having an antigen protein fused to the C-terminal side (extracellular) of a transmembrane domain protein (the N-terminal side of which is intracellular), and then isolating and purifying the antibody from the animal. The antibodies can be used as drugs, vaccines, diagnostic reagents and laboratory reagents. The present sequence encodes a polypeptide, designated HP10390, which we used in the course of the invention.
                                                                                                                                                                                                                                                                                    Antibody preparation by inoculation of an animal with a vector expressing a fusion protein of an antigen on the C-terminal side transmembrane domain for use as drugs, diagnostic reagents and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABL41995

New isolated polynucleotide encoding polypeptide comprising ovarian tumour protein, useful for detection, diagnosis and human ovarian cancer portion င္က င္က

Claim 1; Page 253-254; 285pp; English

The invention relates to an isolated polynucleotide encoding a polypeptide comprising a portion of an ovarian tumour protein. The sequences of the invention are useful for stimulating an immune response and for treating ovarian cancer in a patient. An antigen presenting cell that expresses the sequences is useful for treating ovarian cancer by incubating CD4+ and/or CD8+ T cells isolated from a patient. The T cells can then be proliferated and administered to the patient to inhibit the CC can then be proliferated and administered to the patient to inhibit the CC for nucleic acid hybridisation, to direct expression of a polypeptide in appropriate host cells. Detecting the presence of a cancer in a patient converse obtaining a biological sample from the patient, contacting the biological sample with an agent that binds to the protein, detecting the amount of protein that binds to the agent, comparing the amount of protein that binds to the agent, comparing the amount of cancer. Sequences ABK09464-ABK09802 represent PCR primers and cDNA cancer can be compared to the convention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC This cDNA clone encodes human secretory peptide-9, or Zsig9,
CC variant (see AAW88474). Zsig9 (see also AAW88469) is overexpressed in
CC human brain, liver, lung, oesophageal, stomach, colon, rectal,
CC thyroid and lymphoma tumors. Thus, Zsig can be used as an
CC clone from a full-term pregnancy cDNA vas discovered in a placenta
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA library which contained an
CC clone from a full-term pregnancy cDNA can also be used to determine if Esig9 gene, or probes derived
CC variants and mouse orthologues. The Zsig9 gene, or probes derived
CC liprance from the contained and containe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

The present DNA sequence is a gene encoding the variant of the secretory protein 9, 2sig9 that arises due to alternative splicing, allelic variation or silent mutations that result in amino acid changes. This sequence is mapped to the human chromosome 12q15 region. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to 2sig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to zsig9 and it may be radio-labelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding zsig9. The Zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting

The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           04-SEP-1998;

The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

CC AAA43426 to AAA45925 represent specifically claimed secreted expressed CC sequence tags (SESTs), isolated from human, mouse, chicken and rat CC tissue sources. The SESTs can have a range of activities depending on CC the tissues they were isolated from. The activities include: CC chemotactic; proliferative; immunomodulatory; haematopoletic; cc chemotactic; antipacterial; antifungal; antivital; antifinflammatory; CC cytostatic; antibacterial; antifungal; antivital; antifinflammatory; CC antiasthmatic; vulnerary; antilucer; osteopathic; neuroprotective; CC notropic; antiparkinsonian; antipsoriatic; cerebroprotective; CC notropic; antiparkinsonian; antipsoriatic; cerebroprotective; CC enticonvulsant; and antidepressant. The SESTs can be used for gene CC therapy and in vaccines. The SESTs are useful as probes for the CC identification and isolation of full-length cDNAs and genomic DNA CC molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising CC antibodies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions CC (asthma), myeloid or lymphold cell deficiencies, wounds, burns, ulcers, costeoporosis, osteoparthritis, central nervous system disorders (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation CC disorders (haemophilia, thrombosis), inflammatory disorders (Crohn's CC disease), tumours, bacterial, fungal or viral infections, depression and cc in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mouse; chicken; rat; secreted expressed sequence tag; sEST; expressed sequence tag; sEST; probe; chemotactic; proliferative; immunomodulatory; haematopoletic; chemokinetic; analgesic; haemostatic thrombolytic; antilnflammatory; cytostatic; antibacterial; antifungal, antiviral; antidiabetic; antiasthmatic; vulnerary; antiparkinsonian; antiviral; osteopathic; neuroprotective; nootropic; antiparkinsonian; antilocer; osteopathic; neuroprotective; nootropic; antiparkinsonian; cerebroprotective; anticonvulsant; antidepressant; gene therapy; vaccine; autoimmune disorder; multiple sclerosis; allergic condition; insulin dependent diabetes; asthma; myeloid cell deficiency; ulcer; lymphoid cell deficiency; burn; osteoparosis; osteoarthritis; central nervous system disorder; Alzheimer's disease; stroke; Parkinson's disease; Huntington's disease; coagulation disorder; haemophilia; thrombosis; inflammatory disorder; Crohn's disease;

Six hundred and twenty three polynucleotides derived from a variety human tissue sources which encode secreted proteins, useful for treating immune deficiencies and disorders such as autoimmune disorders. disorders of.

Claim ŗ Page 393pp; English.

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been controlled from a variety of human tissues. The invention also provides the proteins are useful for identifying compounds that modulate their cartity and production. The sequences of the invention are useful for identifying compounds that modulate their cartity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined condectioncy (SICD)), autoimmune disorders (e.g. multiple conditions (e.g. arthritis), infectious disorders (e.g. hepatitis), allowed disorders (e.g. arthritis), infectious disorders (e.g. hepatitis), allowed film (e.g. arthritis), neurodegenerative disorders (e.g. Alzheimer's disease), liver fibrosis, coagulation disorders (e.g. fivention are also useful in gene therapy. ABK35610-ABK30232 represent conditions (e.g. asterna), neurodesed for novel human care accurated proteins.

                                                                                                                                                              This sequence represents the coding sequence of human cDNA clone HP10390 which encodes a 20 kD protein with one putative transmembrane domain in the N-terminus. The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists
                                                                                                                                                                                                                                                                                                                                    (SAGA )

No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6426208
GENERAL INFORMATION:
APPLICANT: Emil D. Kakkis
APPLICANT: Emil D. Kakkis
APPLICANT: Emil D. Kakkis
TITLE OF INVENTION: For producing and Purifying the Same and Methods
TITLE OF INVENTION: Treating Diseases Caused by Deficiencies Thereof
CURRENT APPLICATION NUMBER: US/09/439,923
CURRENT APPLICATION NUMBER: US/09/439,923
CURRENT FILING DATE: 1999-11-12
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 1
LENGTH: 6200
TYPE: DNA
ORGANISM: Homo Sapiens
FEATURE:
NAME/KBT: CDS
LOCATION: (1558)...(3516)
Search completed: March 30, 2003, 20:59:50 Job time: 104.294 secs
